

week-4

Python implementation of Linear regression

```
import numpy as np
import matplotlib.pyplot as plt

def estimate_coef(x, y):
    n = np.size(x)
    m_x = np.mean(x)
    m_y = np.mean(y)
    ss_xy = np.sum(y*x) - n*m_y*m_x
    ss_xx = np.sum(x*x) - n*m_x*m_x
    b_1 = ss_xy / ss_xx
    b_0 = m_y - b_1*m_x
    return (b_0, b_1)

def plot_regression_line(x, y, b):
    plt.scatter(x, y, color="m", marker="o", s=30)
    y_pred = b[0] + b[1]*x
    plt.plot(x, y_pred, color="g")
    plt.xlabel('x')
    plt.ylabel('y')

def main():
    x = np.array([0, 1, 2, 3, 4, 5, 6, 7, 8, 9])
    y = np.array([1, 3, 2, 5, 7, 8, 9, 10, 12])
    b = estimate_coef(x, y)
    print("Estimated coefficients: \nb_0 = {b} \nb_1 = {g}",
          format(b))
```

Output:

(b_0, b_1) = (1.2, 3.63, ..., 1.16969, ...)

multiple suggestion line

```
